9. Exploring AI-Assisted Features and Built-In Analytics (Zia)

1. Aim

To explore and integrate **Zia** (Zoho's built-in AI assistant) and analytics tools into the **Gym Membership Application** to leverage natural language processing, automated data insights, and predictive analytics for membership management.

2. Objective

- Understand how **Zia** brings generative AI and machine learning capabilities into Zoho Creator.
- Utilize AI-assisted form design and field suggestions for optimizing data input.
- Implement built-in analytics and conversational queries to extract business metrics (e.g., active memberships, peak sign-up periods, and revenue trends).

3. Prerequisites & Tools Required

- **Zoho Creator Account** with Zia and AI features enabled.
- **Gym Membership Application** containing historical data (member sign-ups, plans, and renewal tracking).

4. Step-by-Step Implementation Procedure

Step 1: Leveraging Zia for App and Form Optimization

Zia assists developers by interpreting natural language instructions to modify schemas, build components, or suggest fields.

1. Open your **Gym Membership Application** in the Zoho Creator builder mode.
2. Navigate to the form builder for `Member_Registration` or create a new feedback/survey form using **Zia Assistance**.
3. Use the **AI Field Suggestions** feature to automatically recommend standard fields (such as *Emergency Contact*, *Health Conditions*, or *Preferred Workout Time*) based on existing gym application schema context.
4. Review the generated fields and click **Add** to merge them into the active form layout.

Step 2: Implementing Zia Deluge Tasks or Chat Agents

Configure intelligent assistants to handle automated query execution or data processing.

1. Go to **Workflows** > **Deluge Script Editor**.
2. Explore or implement a **Zia Task** block within a script to handle unstructured data text classification, sentiment evaluation on member feedback, or automated text summarization of member notes.
3. Configure the AI provider parameters (such as mapping built-in Zoho GenAI or external LLM connections if configured under settings).

Step 3: Configuring Built-in Reports and Analytics Dashboard

To monitor gym performance metrics using built-in analytical tools:

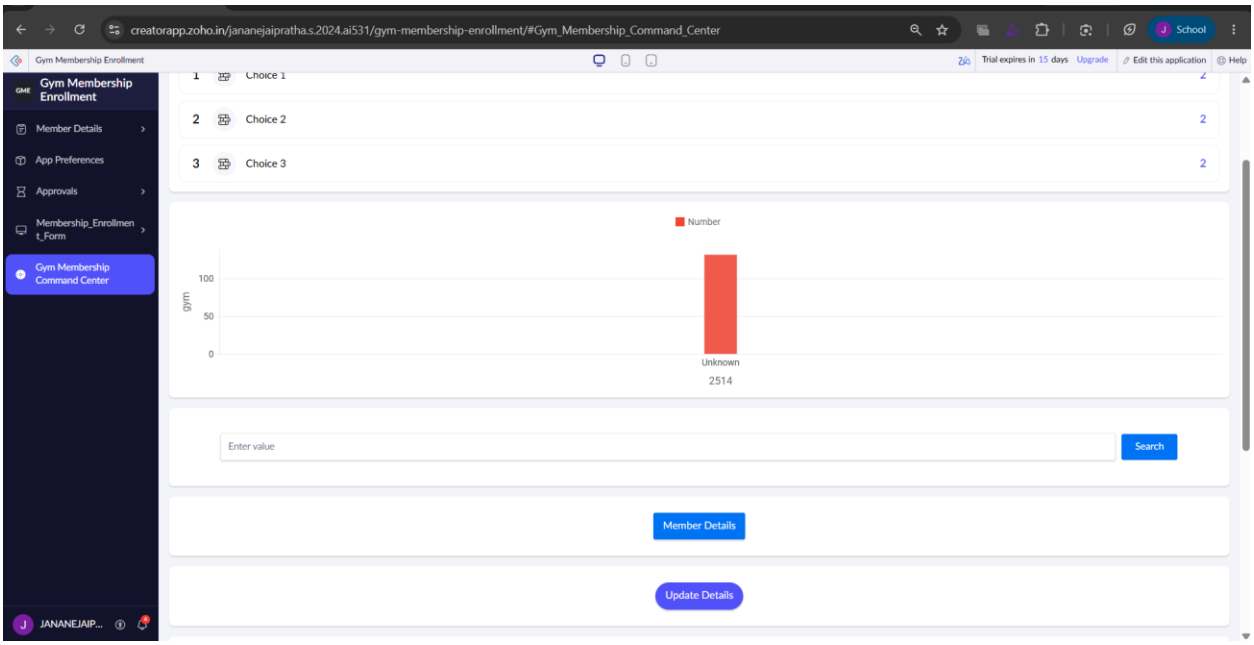

1. Click on the **Analytics** or **Reports** section within your Zoho Creator workspace.

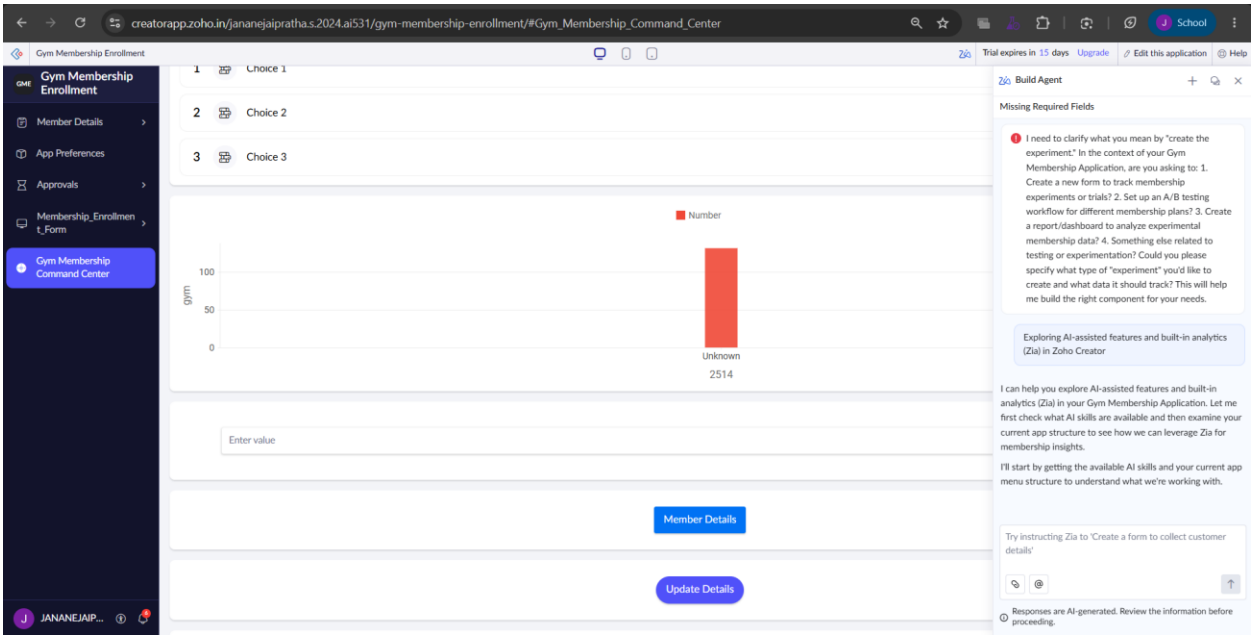

2. Create a new **Chart Report** linked to the `Member_Registration` data source.
3. Set up visual indicators:
    a. **Bar Chart / Pie Chart:** Categorizing members by `Membership_Type` (Basic, Premium, VIP).
    b. **Line Chart:** Tracking member sign-up trends over months/quarters.

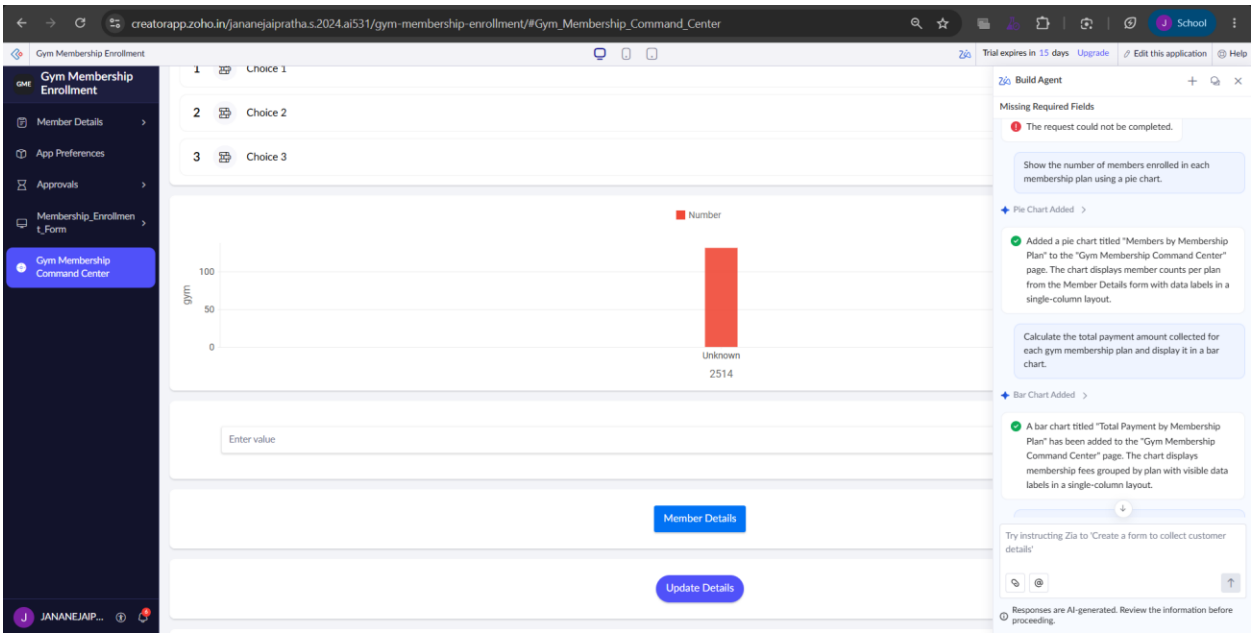

Step 4: Interacting with Data Using Zia Insights / Conversational Analytics

1. Access the dashboard view of your application reports.
2. Use the **Zia Insights** feature (or conversational query box) to ask questions about your data in plain text, such as:
    a. *"Show me the total number of premium sign-ups this month"*
    b. *"Which membership plan has the highest drop-off rate?"*
3. Review the automated trend breakdowns, anomalies, and seasonality patterns generated instantly by Zia's machine learning engine.

Build Agent
Missing Required Fields
I need to clarify what you mean by "create the experiment." In the context of your Gym Membership Application, are you asking to: 1. Create a new form to track membership experiments or trials? 2. Set up an A/B testing workflow for different membership plans? 3. Create a report/dashboard to analyze experimental membership data? 4. Something else related to testing or experimentation? Could you please specify what type of "experiment" you'd like to create and what data it should track? This will help me build the right component for your needs.
Exploring AI-assisted features and built-in analytics (Zia) in Zoho Creator
I can help you explore AI-assisted features and built-in analytics (Zia) in your Gym Membership Application. Let me first check what AI skills are available and then examine your current app structure to see how we can leverage Zia for membership insights.
I'll start by getting the available AI skills and your current app menu structure to understand what we're working with.
Try instructing Zia to 'Create a form to collect customer details'
Responses are AI-generated. Review the information before proceeding.

Result:

AI-assisted features and built-in analytics via **Zia** were successfully explored and integrated into the **Gym Membership Application**.
