11.Deploying a Zoho Creator Application from Development to Production Environment

1. Aim

To migrate, publish, and deploy the **Gym Membership Application** from the **Development (Sandbox/Sandbox Environment)** to the **Production Environment** using Zoho Creator's deployment and migration tools, ensuring seamless transition for live end-users.

2. Objective

- Understand the distinction between the **Development Environment** (where applications are built and tested) and the **Production Environment** (where live users and actual data reside).
- Learn how to use Zoho Creator's **Publish / Application Migration** features to push schema changes, scripts, forms, and reports safely.
- Handle environment-specific configurations (such as connections, API keys, and user permissions) during deployment.

3. Prerequisites & Tools Required

- **Zoho Creator Account** with Administrator or Developer privileges.
- **Gym Membership Application** fully tested and verified in the Development environment.
- Target **Production Environment** space configured within the same Zoho Creator organization.

4. Step-by-Step Implementation Procedure

Step 1: Pre-Deployment Verification and Testing

Before pushing any application to production, ensure that all components are stable.

1. Open your **Gym Membership Application** in **Development Mode**.
2. Run final tests on your forms (`Member_Registration`), reports, and Deluge workflows (such as the CRM integration script and RBAC rules).
3. Check the **Script Execution Logs** to ensure zero errors or unhandled exceptions.
4. Clean up any dummy test records or sample data so the production environment starts with a clean slate.

Step 2: Accessing the Deployment/Migration Tool

Zoho Creator provides structured deployment options depending on whether you are using Environments (Sandbox/Production) or publishing directly.

1. In the application home screen / builder, navigate to **Settings** > **Publish** or **Environments**.
2. If using the **Environments** feature:
    a. Select the **Development** workspace.
    b. Click on **Deploy to Production** (or **Promote to Production**).
3. If publishing a standalone app version:
    a. Click on the **Publish** button located in the top right corner of the app builder.

Step 3: Reviewing Component Changes and Dependencies

When initiating the deployment wizard, Zoho Creator displays a change log or diff summary.

1. Review the list of modified components that will be pushed to production:
    a. **Forms & Fields** (e.g., `Member_Registration`, new Zia-suggested fields)
    b. **Reports & Pages** (e.g., `All_Members` chart dashboards)
    c. **Workflows & Deluge Scripts** (e.g., API integration functions)
2. Ensure that any external **Connections** (like `zoho_crm_connection`) are re-authenticated or mapped correctly to the production account credentials, as sandbox connections often require separate authorization in production.

Step 4: Executing the Deployment

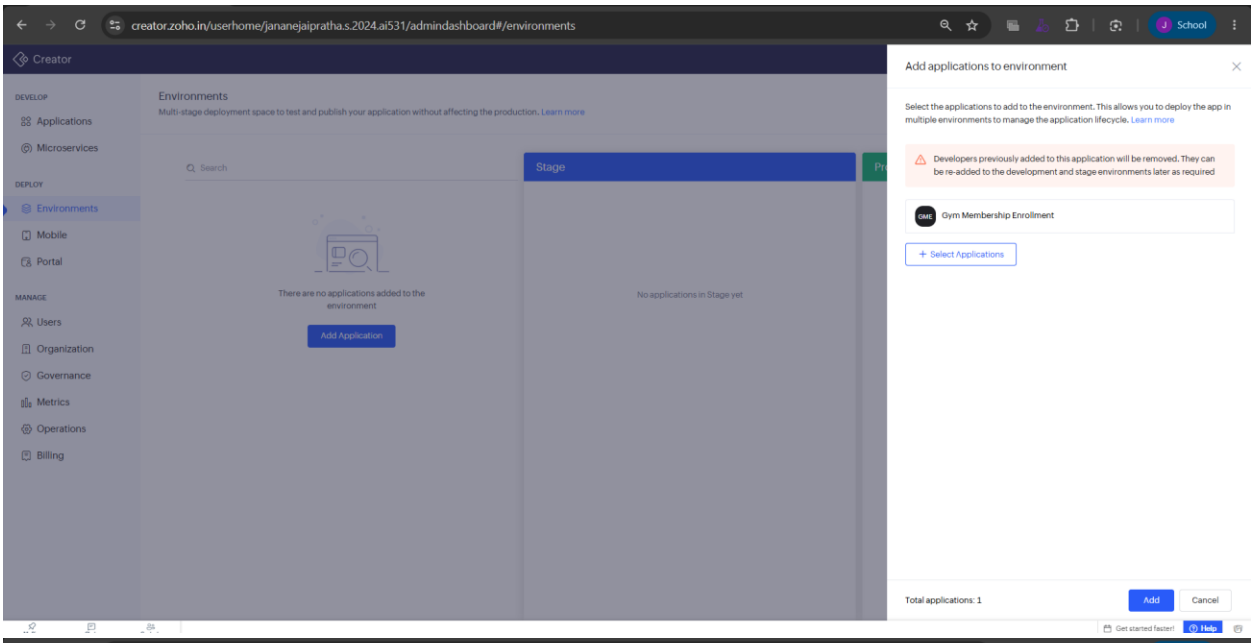

1. Click **Confirm & Deploy** (or **Publish Application**).
2. Wait for the background compilation and migration process to complete. A success notification will appear indicating that the production environment has been successfully updated with the latest build.

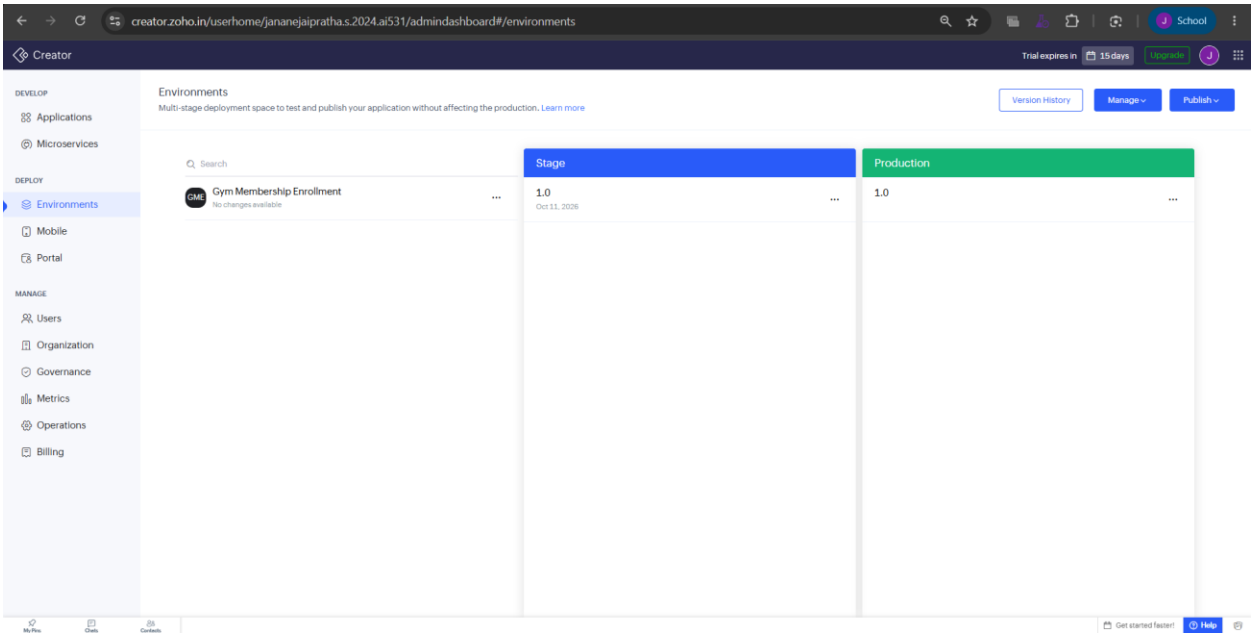

Step 5: Accessing and Sharing the Production App

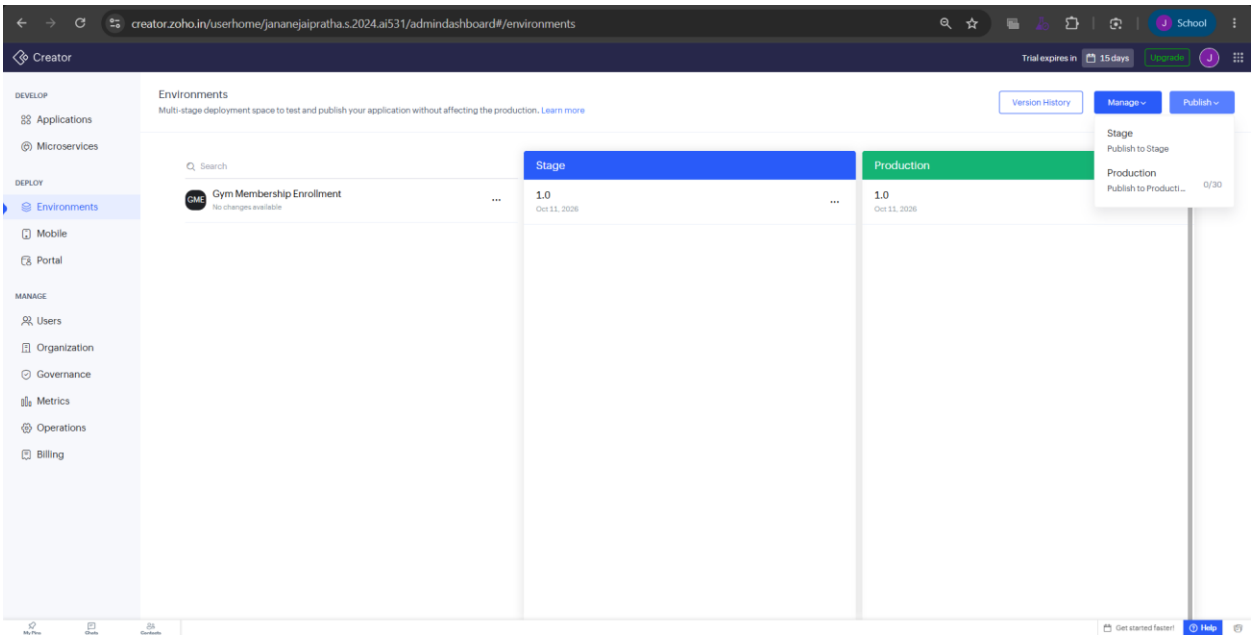

1. Switch your view to the **Production Environment** URL or click **Access Live Application**.
2. Verify that the URL reflects the production domain rather than the development sandbox link.

3. Assign initial production users via the **Users & Permissions** module (re-verifying that RBAC roles such as *Administrator*, *Gym Trainer*, and *Member* are properly active).

Result:

The **Gym Membership Application** was successfully promoted and deployed from the development workspace to the production environment. This experiment highlights the best practices of safe application lifecycle management (ALM), ensuring that updates are thoroughly tested before going live to end-users.
